C;Comment: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are h;
C;Comment: The type III collagen molecule is a trimer of identical chains, linked to each
C;Comment: The type III collagen alpha 1(I) chain; fibrillar collagen carboxyl-terminal homology;
C;Keywords: collagen alpha 1(III) chain #status experimental <CAB>
F;1-104/Region: amino-terminal nonhelical telopeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A;Accession: A38002

May play a role in constraining the orientation of longitudinally projecting axons (By similarity).
SUBUNIT: Interacts with GRIP1 and GRIP2.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Highly expressed in brain; expressed embryonic floor plate, roof plate and hindbrain segments.
SIMILARITY: Belongs to the ephrin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               86

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           vitro. May play a role in constraining the orientation of longitudinally projecting axons.
SUBUNIT: Interacts with GRIP1 and GRIP2 (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed on lateral floor plate cells, specifically on commissural axon segments that have passed throug the floor plate. Expressed in cells of the retinal ganglion cell layer during retinal axon guidance to the optic disk.
DEVELOPMENTAL STAGE: Expressed in the floor plate throughout the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  European

I SUBCELULAR LOCATION: Type I membrane protein.

TISSUE SEBCIFICITY: Expressed on lateral floor plate cel specifically on commissural axon segments that have pass the floor plate. Expressed in cells of the retinal gangl layer during retinal axon guidance to the optic disk.

Layer during retinal axon guidance to the optic disk.

DEVELOPMENTAL STAGE: Expressed in the floor plate throug period of commissural axon pathfinding.

PMM: Inducible phosphorylation of tyrosine residues in t cytoplasmic domain (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Himanen J.-P., Rajashankar K.R.,

CFNS is an X-linked inherited syndrome characterized by hypertelorism, coronal synostosis with brachycephaly, downslanting palpebral fissures, clefting of the nasal tip, joint anomalies, longitudinally grooved fingernails a other digital anomalies.

SIMILARITY: Belongs to the ephrin family.
                                                                                                                                                                                                                         340

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903 (2002).

C. FUNCTION: Binds to the receptor tyrosine kinases EPH May play a role in constraining the orientation of 1 projecting axons (By similarity).

C. I SUBUNIT: Interacts with PDZRN3 (By similarity). Bind receptor tyrosine kinases EPHB4 and EPHA3.

C. I SUBCELLULAR LOCATION: Type I membrane protein.

I TISSUE SPECIFICITY: Lung and kidney.

C. I SUBCELLULAR LOCATION: Type I membrane protein.

I TISSUE SPECIFICITY: Lung and kidney.

C. I SIMILARITY: Belongs to the ephrin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Strausberg R.L., Feingold E.A., Grouse L.H., Derge J.G.,
